

# Electronic Part Obsolescence – Life Cycle Optimization and Cost

---

CALCE Electronic Products and Systems Center  
Obsolescence/Technology Insertion

University of Maryland

## Life Cycle Optimization

Given some ability to forecast part obsolescence (and potentially forecast functional upgrade opportunities), how can this information be used to optimize the lifecycle of the product?

- Lifetime buy vs. design refresh tradeoffs (Boeing, Raytheon)
- Design refresh optimization - MOCA (University of Maryland)\*
- Resource allocation decision support system – RADSS (Litton-TASC)\*
- Reengineering tools (synthesis)\*

\*Ongoing development through Air Force Electronic Parts Obsolescence Initiative (EPOI)

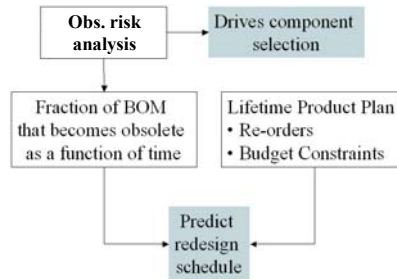

---

CALCE Electronic Products and Systems Center  
Obsolescence/Technology Insertion

University of Maryland

## Conventional Use of Obsolescence Data During the Design Stage

- The majority of the military, avionics and automotive community either ignore obsolescence risk or use it only during the component selection process at the design stage
- Some organizations use obsolescence risk information to predict redesigns

- Conventional methods of predicting the economic impact of obsolescence take into account the obsolescence risk, but **do not** account for part-specific obsolescence mitigation strategies
- The analysis is usually restricted to lifetime buy vs. redesign trade-offs

## Last Time Buy vs. Redesign

### Basic Concept:

- If a redesign can be deferred to a future year, the net present value (NPV) of the redesign cost decreases as the redesign is postponed
- As the redesign is deferred, more parts need to be purchased (last time buy) to support production and repair of the current design, thus increasing the sustainment cost
- The optimum year for redesign is the minima in the sum of the two curves

Note, this modeling approach does not account for the performance or maintenance “value” of the redesign

## Net Present Value (NPV) of Redesign Costs

NPV = Net Present Value is a way of comparing the value of money now with the value of money in the future. A dollar today is worth more than a dollar in the future, because inflation erodes the buying power of the future money, while money available today can be invested and grow.

$$\text{Present Value} = \frac{V_n}{(1+d)^n}$$

Present value of an investment worth  $V_n$ ,  $n$  years from the present with a constant discount rate (rate of return on investment) of  $d$

$$\text{Net Present Value} = \sum_{i=0}^n \frac{B_i - C_i}{(1+d_i)^i}$$

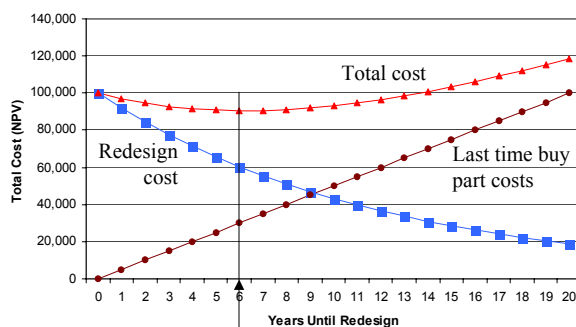

Present value of an annual value  $V_i = B_i - C_i$ ,  $n$  years from the present with an annual discount rate of  $d_i$ .  $B_i$  and  $C_i$  are the benefit and cost in the  $i$ th year.

$$\text{Redesign Cost (NPV)}_i = \frac{\text{Inflation adjusted redesign cost}_i}{(1+d)^i} \quad \text{in the } i\text{th year}$$

CALCE Electronic Products and Systems Center  
Obsolescence/Technology Insertion

University of Maryland

## Last Time Buy vs. Redesign (A Very Simple Example)

Total cost = redesign cost  
+ last time buy part costs

Assumes one part goes  
obsolete in year 0

Redesign in year 6

Return on investment  
via some other use of  
the money

Example Analysis Data:

|   |         |
|---|---------|
| Redesign cost (year 0)                        | 100,000 |
| Inflation rate (%)                            | 3       |
| Discount rate (%)                             | 12      |
| Number of the obsolete part needed per year   | 500     |
| Obsolete part price at last time buy (year 0) | 10      |

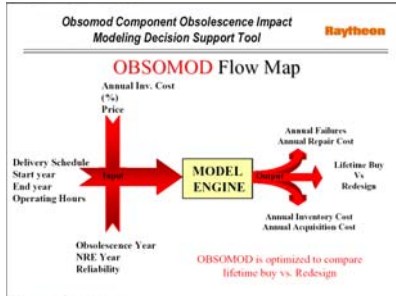

CALCE Electronic Products and Systems Center  
Obsolescence/Technology Insertion

University of Maryland

## Last Time Buy vs. Redesign

The simple analysis can be expanded to include:

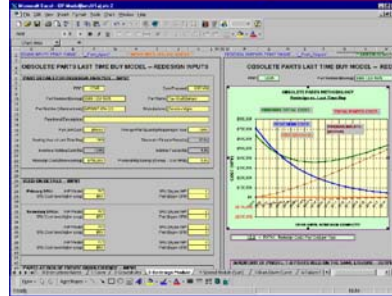

- Multiple obsolescence events
- Annual inventory costs
- Reliability models to predict annual product quantities

### Raytheon Tool:

J. Mainwaring, "Technology Obsolescence and Sustainment," Lower Voltage Technology Initiative Government/Industry Workshop, July 1999.

CALCE Electronic Products and Systems Center  
Obsolescence/Technology Insertion

### Boeing Tool:

Z. Porter, "An Economic Method for Evaluating Electronic Component Obsolescence Solutions," Boeing Corporation.

University of Maryland

## Price-Based vs. Cost-Based

### Cost-Based Model:

- Incentive for the prime contractors and OEMs to defer a redesign as long as possible and let the customer pay for the both the obsolescence-driven upgrade and the performance improvements concurrently
- A lifetime buy vs. redesign analysis is a valuable tradeoff of this approach

### Price-Based Model:

- Prime contractors and OEMs are allowed to "pocket" recurring cost savings that result from redesigns, thus providing an incentive to redesign as soon as it makes sense.
- Different analysis needed...

CALCE Electronic Products and Systems Center  
Obsolescence/Technology Insertion

University of Maryland

## Design Refresh Planning

Design refreshes (redesigns) of electronic systems are performed to update functionality/performance/ technology, and to mitigate electronic part obsolescence problems.

However, design refreshes of avionics systems, potentially require large expenditures for re-engineering and re-qualification.

The challenge is to determine the optimum design refresh plan that balances obsolescence mitigation with the expense of redesign.

Software tool and methodology for refresh planning:  
MOCA = Mitigation of Obsolescence Cost Analysis

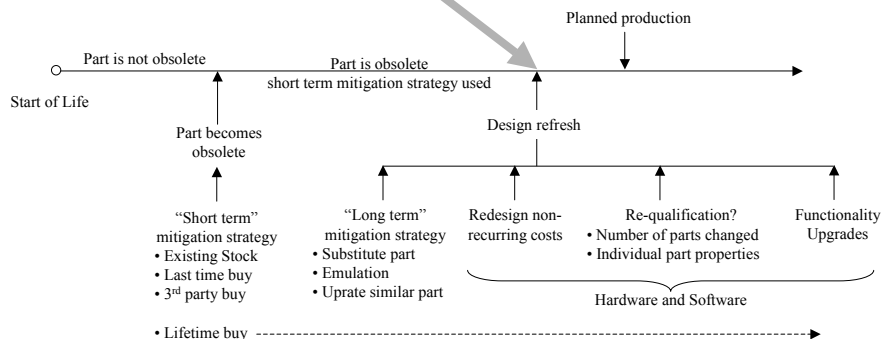

CALCE Electronic Products and Systems Center  
Obsolescence/Technology Insertion

University of Maryland

## MOCA Design Refresh Optimization Landscape

Optimum location(s) of these refreshes depends on:

- which part(s) become obsolete
- when they become obsolete
- how the obsolescence is mitigated
- resulting system re-qualification requirements

Obsolescence/Technology Insertion

University of Maryland

## Example MOCA Design Refresh Result

- 1 year look ahead
- 20 year product life (3200 units manufactured)
- 200 component re-qualification trigger
- \$136,000 full re-qualification cost

CALCE Electronic Products and Systems Center  
Obsolescence/Technology Insertion

University of Maryland

## RADSS (Litton TASC\*)

Part obsolescence management system based on commercially available Resource Allocation Decision Support System (RADSS)

RADSS makes optimum part obsolescence management decisions (based on known part obsolescence and discontinuance) in a resource budget constrained environment

The primary purpose of the tool is to aid the user in making financial management or investment decisions

This tool may enable “best value” decisions, i.e., value = financial, performance, customer requirements satisfaction

(<http://www.tasc.com>)

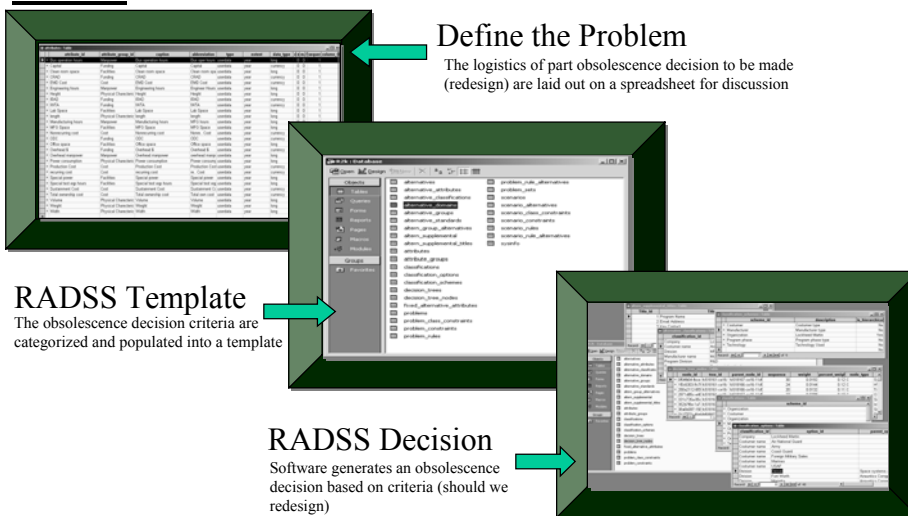

\*Now part of Northrop Gumman

CALCE Electronic Products and Systems Center  
Obsolescence/Technology Insertion

University of Maryland

## RADSS - Model for Complex Obsolescence Decisions

### Process:

CALCE Electronic Products and Systems Center  
Obsolescence/Technology Insertion

University of Maryland

## Reengineering Tools

Objective: provide automated VHDL model generation tools, libraries of simulatable and synthesizable virtual components, and legacy software modeling:

- 1) Design extraction from an obsolete platform
- 2) Architectural design tradeoff analysis
- 3) Synthesize new hardware and software to replace the obsolete portion of the system
  - Redesign advisor (VP Technologies, [www.vptinc.com](http://www.vptinc.com))
  - Behavioral product reengineering tool (Synopsis)
  - Design verification test generation tool (University of Cincinnati)

These are essentially ASIC-based obsolescence mitigation solutions and thereby suffer from the ASIC problems previously discussed

## Publicly Available Life Cycle Costing Tools (Used for Military and Avionics Products)

None of the following tools model the cost impacts of obsolescence, however, all provide critical elements of the calculation

Hardware Development and Production:

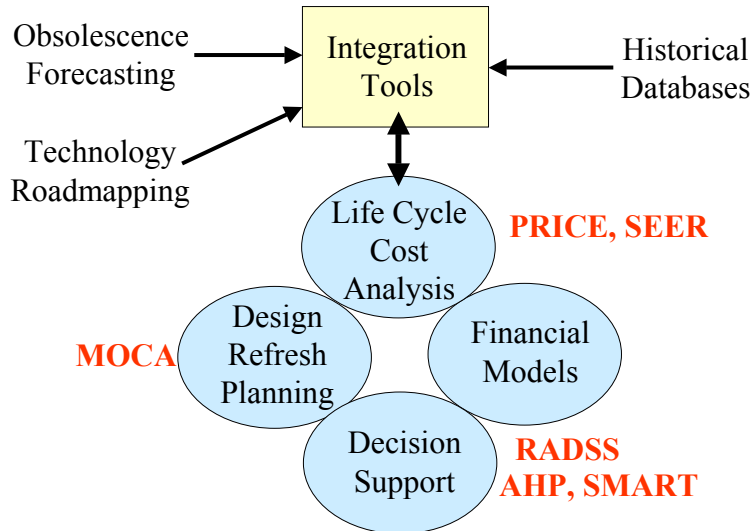

- Price-H/HL/M
  - SEER-H/I
- } Complexity based parametrics

Software Development, Maintenance and Testing:

- Price-S
  - SEER-SEM
  - COCOMO
  - SAGE
- } Source lines of code based parametrics
- Development team based parametrics

- ICE (Frontier) Tool/data integration environment

## ***A High-Altitude View of the Design Tool Space***

CALCE Electronic Products and Systems Center  
Obsolescence/Technology Insertion

University of Maryland

## **Software Obsolescence**

When the system hardware is modified via a design refresh, the system software and/or the system's software qualification may have to be refreshed too.

Challenge:

- Determine what software needs to be refreshed
- Figure out the cost of the software refresh
- Determine if the software needs to be re-qualified
- Figure out the cost of the software re-qualification
- Include these effects within the design refresh optimization

CALCE Electronic Products and Systems Center  
Obsolescence/Technology Insertion

University of Maryland

## **Standards and Specifications/ Requirements Obsolescence**

The standards, specifications, and/or requirements used when designing and manufacturing a system may change or be obsoleted during a system's sustainment life, i.e., a system can no longer deliver the required performance to meet the customer's need (e.g., insufficient memory or processor).

This type of obsolescence may result in obsoleting an electronic part's applicability to for use in the system, i.e., the part itself is not obsolete, but its performance or reliability no longer satisfy the new system requirements.

## **Mitigating Standards and Specifications/ Requirements Obsolescence**

Standards, Specifications, and Requirements changes are expected by difficult to predict.

There are system-level strategies that allow us to mitigate the the impact of unexpected changes (e.g., “encapsulation” of the standards as much as possible so that changes in standards are transparent to the system)

This is what “upgradability” is all about, i.e., the capability to accommodate and exploit new technologies with minimum impact in order to meet evolving performance requirements

## ROI/Cost Avoidance Associated with Obsolescence Management

The best (only) actual data on costs associated with electronic part obsolescence management is from a DMEA study in 1999:

J. McDermott, J. Shearer, and W. Tomczykowski, "Resolution Cost Factors for Diminishing Manufacturing Sources and Material Shortages," ARINC, February 1999.  
(<http://smaplab.ri.uah.edu/dmsms98/papers/trunnell.pdf>)

This study lays out the following items associated with obsolescence mitigation alternatives:

- 1) Non-recurring cost factors
- 2) Recurring cost multipliers
- 3) Cost avoidance values

**Comment:**  
This data assumes maintaining only a legacy performance capability, i.e., does not figure in functional upgrades

CALCE Electronic Products and Systems Center  
Obsolescence/Technology Insertion

University of Maryland

## Non-Recurring Cost Factors for Obsolescence Resolutions in Avionics

| Resolution       | Low (\$) | Average (\$) | High (\$) |
|------------------|----------|--------------|-----------|
| Existing Stock   | 0        | 0            | 0         |
| Reclamation      | 1000     | 2000         | 3000      |
| Alternate        | 4000     | 7000         | 9000      |
| Substitute       | 15000    | 19000        | 24000     |
| Aftermarket      | 41000    | 50000        | 59000     |
| Emulation        | 55000    | 72000        | 89000     |
| Redesign – Minor | 82000    | 117000       | 153000    |
| Redesign – Major | 361000   | 433000       | 505000    |
| Life of Type Buy | *        | *            | *         |

(2001 Dollars)

\* The LOT buy resolution is program specific and should be calculated by individual programs

J. McDermott, J. Shearer, and W. Tomczykowski, "Resolution Cost Factors for Diminishing Manufacturing Sources and Material Shortages," ARINC, February 1999. (<http://smaplab.ri.uah.edu/dmsms98/papers/trunnell.pdf>)  
Supplemental Report, "Resolution Cost Factors for Diminishing Manufacturing Sources and Material Shortages," ARINC, December 2001.

Obsolescence/Technology Insertion

University of Maryland

## Additional NRE Costs

The previous chart does not include the following additional NRE costs:

- New source qualification - \$20,000 to \$161,000
- Radiation hardening qualification
  - Dose rate \$15,000-\$20,000
  - Total dose \$5,000-\$12,000
  - Single event upset \$15,000-\$20,000 (microprocessors up to \$50,000)
- PEM qualification
  - Acoustic microscopy \$1,800-\$1,890
  - 100% screening \$13,250
  - package qualification \$27,150-\$32,200

J. McDermott, J. Shearer, and W. Tomczykowski, "Resolution Cost Factors for Diminishing Manufacturing Sources and Material Shortages," ARINC, February 1999.

## Obsolescence Management

### Reactive mitigation approaches:

- Existing stock
- Substitute part
- Aftermarket supplier
- Life of type buy
- Uprate commercial part
- Emulation
- Reclamation (salvage)
- Reverse engineer
- Design refresh

ROI = 3:1

R. Stogdill, "Dealing with  
Obsolete Parts," IEEE Design &  
Test of Computers, April-June  
1999

### Proactive management approaches:

- Reengineering tools
- Obsolescence mitigation decision making tools
- Obsolescence forecasting
- Design and lifecycle optimization tools

ROI = 18:1

Design capture as executable  
specification/simulation objects  
(Northrop E3 AWACS)

ROI = 100:1
